Your doctor recommends the shingles vaccine

SHINGRIX is an FDA-approved vaccine for the prevention of shingles (herpes zoster) in adults 50 years and older. SHINGRIX is not used to prevent chickenpox.

Shingles is a painful, blistering rash that can take 2 to 4 weeks to clear up.

Protect yourself by getting vaccinated at your local pharmacy.

Make an appointment today.

SHINGRIX is $0 for almost everyone
$0 with Medicare Part D, $0 for 95% of privately insured
See SHINGRIX.com for details

99.5% of people 50 years and older already have the virus that causes shingles inside them. 1 in 3 people will develop shingles in their lifetime.

Most people who get shingles experience acute pain, and many describe the pain as aching, burning, stabbing, or shock-like.

Shingles may lead to long-term complications such as debilitating pain that lasts for months or even years. In rare cases, serious, long-term eye or hearing issues can occur.

The most common side effects of SHINGRIX are pain, redness, and swelling at the injection site, muscle pain, tiredness, headache, shivering, fever, and upset stomach.

Remember, SHINGRIX is a 2-dose vaccine, so flip over to the back to learn more about scheduling your second dose.

Please see reverse side for additional Important Safety Information about SHINGRIX.
Please see accompanying Important Facts About SHINGRIX.
Schedule your second dose

Get the full protection of SHINGRIX by completing the 2-dose series.

If you received the first dose at your doctor’s office, make an appointment to return to the office for your second dose.

If you received your first dose at your local pharmacy, make an appointment with them to return for your second dose.

In clinical trials, two doses of SHINGRIX were proven to be over 90% effective in preventing shingles in adults 50 years and older, so schedule your second dose for 2–6 months from your first dose.

Understand potential side effects

After each dose of SHINGRIX, you may experience pain, redness, and swelling at the injection site. Other common side effects include muscle pain, tiredness, headache, shivering, fever and upset stomach. Contact your healthcare provider if you have any concerns.

Severe allergic reactions are less common, but can include hives, swelling of the face or throat, difficulty breathing, a fast heartbeat, dizziness, and weakness. If you experience any of these symptoms, seek immediate medical attention.

Important Safety Information

• You should not receive SHINGRIX if you are allergic to any of its ingredients or had an allergic reaction to a previous dose of SHINGRIX.

• An increased risk of Guillain–Barré syndrome (severe muscle weakness) was observed after vaccination with SHINGRIX.

• Fainting can happen after getting injectable vaccines, including SHINGRIX. Precautions should be taken to avoid falling and injury due to fainting.

• The most common side effects are pain, redness, and swelling at the injection site, muscle pain, tiredness, headache, shivering, fever, and upset stomach.

• SHINGRIX was not studied in pregnant or nursing women. Tell your healthcare provider if you are pregnant, plan to become pregnant, or are breastfeeding.

• Vaccination with SHINGRIX may not protect all individuals.

• Ask your healthcare provider about the risks and benefits of SHINGRIX. Only a healthcare provider can decide if SHINGRIX is right for you.

You are encouraged to report vaccine adverse events to the US Department of Health and Human Services. Visit www.vaers.hhs.gov to file a report, or call 1-800-822-7967.
